

Sanden International (U.S.A.) , Inc. begins production of its first electric compressor in North America

Sanden International (U.S.A.), Inc., a Group company, started full-scale operation of a production line for electric compressors for electric vehicles (EVs), the first of its kind in our North American area, in order to expand its production system.

This has enabled us to realize a four-pole production system (Japan, China, Europe, and the Americas) in line with the accelerating shift to electrification in the automotive industry, and to manufacture and deliver our products close to our customers. It is also expected to reduce CO2 emissions in logistics, contributing to our efforts to achieve carbon neutrality.

Sanden International (U.S.A.) (Wylie)

Electric Compressor

We aim to expand our thermal management products for electric vehicles, including electric compressors, to supply electric vehicle manufacturers in the Americas and respond to the growing market for electric vehicles in North America. The annual production volume in North America will reach 600,000 units, and this operation will bring the total global production capacity of electric compressors to 3 million units. By promoting productivity improvement in each region and horizontally spreading the know-how to other production bases, we will strive to further improve production capacity on a global basis.

Sanden International (U.S.A.), Inc. began operations in 1974 as the Group's first overseas production plant. The new plant marks a major turning point in the history, as it will begin production of products for electric vehicles.

The full-scale start-up ceremony for the production line was attended by many people, including the mayor of Wylie, where the plant is located, the Texas House of Representatives, the governor's office, local universities, and business partners. The new production line and its future development and growth are expected to create job opportunities and promote economic growth in the region. Sanden International (U.S.A.), Inc. is committed to further growth as a company that benefits not only the industry but also the local community.
